

Secure 2 Fiber

We offer the
**FUTURE
SOLUTION**
FOR IT INFRASTRUCTURE

Maximum flexibility
for critical networks

AIM Backup Module

The AIM Backup module for secure and reliable data backup in companies.

Central management and execution of config backups - independent of manufacturer.

- Central control of all config backups via a standardized interface
- Administrators can organize, monitor and evaluate all backup processes in one place.

Flexible adjustment of backup cycles

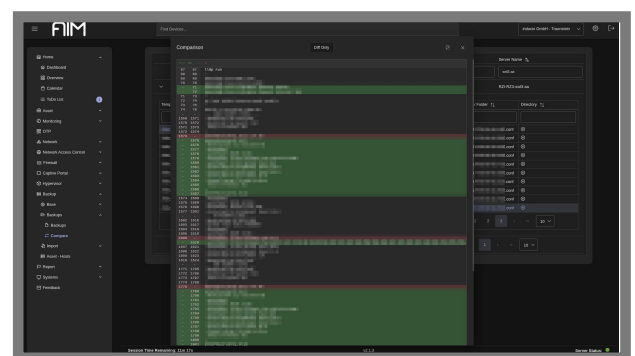

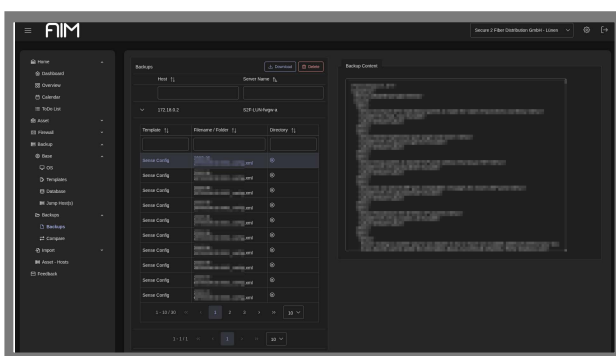

- Individual backup cycles can be defined for each asset (e.g. server, database, application)
- Alternatively, backup cycles can be efficiently defined using centrally provided templates and applied to multiple assets

Centrally managed and provided standard templates

- The module offers standard templates that can be maintained centrally and used throughout the organization
- Templates simplify the rollout of backup strategies and ensure uniform backup standards

Configurable backup cycles and retention times

- Backup schedules can be adapted precisely to the requirements of the respective systems
- The retention time of backups can be configured individually so that compliance requirements can be implemented flexibly

**FUTURE
SOLUTION**
FOR IT INFRASTRUCTURE

Maximum flexibility
for critical networks

AIM Backup Module

Secure remote access via Jump Host functionality

- Backup operations on remote systems are secured and controlled by an integrated jump host function
- This enables secure, encrypted and controlled connections to remote assets for performing backups even to hosts that are not directly accessible

Integrated backup comparison function

- The module has a comparison function that makes it possible to compare different backup statuses with each other
- This facilitates the targeted restoration of individual files or entire systems and increases the transparency of the backup inventory

CSV import for efficient mass management

- Assets, backup configurations or user master data can be easily and quickly imported into the system using the CSV import function
- The import facilitates the initial creation and ongoing updating of large inventories of backup-relevant objects
- The clear assignment and automatic verification of imported data saves time and minimizes errors
